1. **Test 02 A/Test 02 A/Program.cs**

```
namespace Test_02_A
{
    internal class Program
    {
        static void Main(string[] args)
        {
            int[] arr1 = new int[]
            {
                7,
                3,
                1,
                8,
                2,
                4,
                5,
                0,
                9
            };
            int[] arr2 = new int[]
            {
                1,
                2,
                4
            };
            double result1 = LargerRunningAverages(arr1);
            double result2 = LargerRunningAverages(arr2);
            Console.WriteLine(result1);
            Console.WriteLine(result2);

        }
        public static double LargerRunningAverages(int[] array)
```

1. **Test 02 A/Test 02 A/Program.cs**

```
    {
        double sum = 0;
        int count = 0;
        double previousum = 0;
        double runningAverage = 0;
        double Average = 0;
        for (int i = 0; i < array.Length; i++)
        {
            previousum += array[i];
            runningAverage = (previousum / (i + 1));

            if (array[i] > runningAverage)
            {

                sum += array[i];
                count++;
            }
        }
        if (count == 0)
        {
            return 0;
        }
        else
        {
            Average = (double) sum / count;
        }

        return Average;
    }

1. Test 02 A/Test 02 A/Program.cs

```
    }
}
```

2. Test 02 A/Test 02 B/Program.cs

```
using System.Reflection.Metadata.Ecma335;

namespace Test_02_B
{
    internal class Program
    {
        static void Main(string[] args)
        {
            int[] arr = {
                7,
                3,
                1,
                8,
                2,
                4,
                5,
                0,
                9
            };
            int[] result = newarray(arr);
            Console.WriteLine(string.Join(", ", result));

        }
        public static int[] newarray(int[] array)
        {

            int length = (array.Length * (array.Length + 1)) / 2;

            //create a new method that accepts array
            int[] newarray = new int[length];
```

B1

132

2. **Test 02 A/Test 02 B/Program.cs**

you need to offset your j correctly.

```
        //copy all the values from the original array into the
          newarray.

        for (int i = 0; i < array.Length; i++)
        {
            newarray[i] = array[i];
        }

        //  Console.WriteLine(string.Join(", ", newarray));
        int index = array.Length;
        int smallestvalue = 0;
        int smallestindex = 0;
        for (int i = 0; i < array.Length; i++)
        {
            smallestvalue = array[i];
            smallestindex = i;
            for (int j = 0; j < array.Length; j++)
            {
                if (newarray[j] < smallestvalue)
                {
                    smallestvalue = newarray[j];
                    smallestindex = j;
                }
            }
            for (int j = 0; j < newarray.Length - 1; j++)
            {
                if (newarray[j] ≠ smallestvalue)
                {
                    if (index < newarray.Length)
                    {
```

B2

B5

B4

j needs to be offsetted to the correct block.

Find the smallest.

j != smallestindex

not using the correct segment.

2. **Test 02 A/Test 02 B/Program.cs**

```
                    newarray[index] = newarray[j];
                    index++;

                }

            }

            array[smallestvalue] = newarray[j];

        }

        if (index < newarray.Length)
        {
            newarray[index] = newarray[newarray.Length - 1];
        }

    }

    return newarray;

}

}
}
```

I'd say good try, but not quite.

B3

good

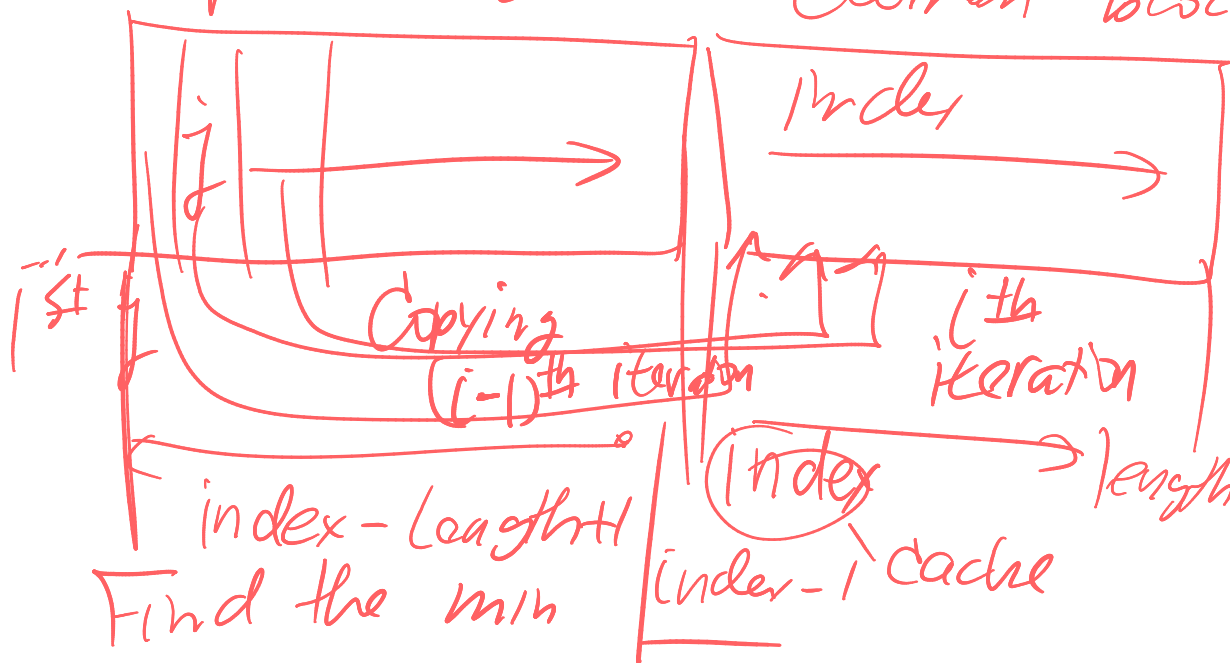
j needs to be offsetted to the previous block, not beginning

what is this for ???

Smallest value or Smallest index?

keep track of additional indexes

You need to visualize, then break up your problem



Find the min
